For the first time, we have shown that the *in vivo* and *in vitro* effects of the same chemical are not necessarily the same. The *in vivo* effects of the chemical are determined by the complex interactions of the chemical with the organism, while the *in vitro* effects are determined by the chemical's direct interaction with the cells. The *in vivo* effects of the chemical are determined by the chemical's ability to reach the target cells, while the *in vitro* effects are determined by the chemical's ability to interact with the target cells. The *in vivo* effects of the chemical are determined by the chemical's ability to reach the target cells, while the *in vitro* effects are determined by the chemical's ability to interact with the target cells.
